

## NetGain IT Monitoring and Security Management solutions

In today's IT context, IT monitoring and Security management is not simply the setting up of rules and the installation of firewalls. Rather, it involves the gathering of data about what is happening in and to the hardware and software in the IT environment, allowing for a proper analysis to determine if the IT equipment is performing to satisfactory service levels, and to identify early warning signs of potential problems in order to resolve them in a timely manner.

NetGain's IT Monitoring and Security Management family of solutions aims to do just that and more, with a goal of making it simple and easy to keep the IT infrastructure up and running and protected, while allowing for a high degree of customization to meet every organization's unique Service Level requirements.

The NetGain IT Monitoring and Security Management solutions include NetGain Enterprise Manager (EM) solutions, NetGain SIEM (Security Information and Event Management) and NetGain Cloud Vista Suite (CVS).

## NetGain IT Monitoring and Security Management solutions

### NETGAIN ENTERPRISE MANAGER (EM)

NetGain EM provides comprehensive visibility to your IT infrastructure, including asset status, network traffic, and changes made to the network configuration. The latest version of NetGain EM has significant performance improvements throughout with the incorporation of the Elastic Stack from Elasticsearch. The Graphic User Interface (GUI) has also been re-engineered and refreshed to provide users with an easy to use and intuitive management experience.

### NETGAIN SIEM (SECURITY INFORMATION AND EVENT MANAGEMENT)

NetGain SIEM aggregates and analyses activity from multiple resources to provide you with real-time analysis of events for security monitoring, and long-range analytics for historical analysis and reporting. While it is a standalone Security Management solution, NetGain SIEM is also integrated into the reporting dashboard of NetGain EM, providing you with a single pane of glass from which to manage both IT Infrastructure and Security events.

### NETGAIN CLOUD VISTA SUITE (CVS)

NetGain CVS lets you manage all your on-premise and cloud IT assets, whether they are in physical, cloud or hybrid networks. It is also designed as a “Manager of Managers” in large and complex IT networks that are geographically distributed, providing you with a single consolidated view of all the IT infrastructure and security events throughout your entire operations. NetGain CVS is also ideal for Managed Service Providers looking for a highly scalable and cost-effective managed cloud solution to offer their clients IT infrastructure monitoring and SIEM as a service.

## NetGain IT Monitoring and Security Management solutions

### BENEFITS

#### One Integrated Solution

NetGain's IT Monitoring and Security Management solutions allow you to monitor and manage a wide range of devices, both on-premise and in the cloud - from the network and security devices, to servers, virtual machines, storage and databases, applications, and even IoT devices like IP cameras, UPS, and Point-of-Sales. Device monitoring AND Security monitoring are integrated into a single pane of glass, so you only need to go to 1 place to ensure that your IT infrastructure is stable and available.

#### Fully Customizable

You can customize the thresholds for different devices in different locations to match your organization's risk profile, while allowing you to set different thresholds for devices in critical operations or locations. You can also easily add and redefine the events that constitute a security threat, allowing you to customize the solution to suit the security posture of your organization, and to remain relevant in the ever-changing threat landscape.

#### Simplified Operations

Monitoring and managing the IT infrastructure against failure and cyber threats can be a daunting task. With NetGain's easily customizable dashboards, you can have a simple yet clear overview of the status of the areas critical to your organization. There is also an Advanced Intelligence Workflow tool which simplifies the creation of a new threat rule by letting you create a visual workflow to easily implement the required detection logic without writing a single line of code.
